The boundary of complex hyperbolic 2-space is the one point compactification of the Heisenberg group in the same way that the boundary of real hyperbolic space is the one point compactification of Euclidean space of one dimension lower.

Hyperbolic geometry wikipedia, properties relation to euclidean geometry hyperbolic geometry is more closely related to euclidean geometry than it seems: the only axiomatic difference is the parallel postulate when the parallel postulate is removed

Kahn and Markovic's proof is a prime example of the interplay between three-dimensional topology and geometry: the incompressible surface theorem is a purely topological statement, but to prove it, Kahn and Markovic drew heavily on the wealth of additional structure that hyperbolic geometry provides.

Chapter 2 Complex Hyperbolic Geometry In complex hyperbolic geometry we consider an open set biholomorphic to an open ball in  $\mathbb{C}^n$ , and we equip it with a particular metric that makes it have constant negative holomorphic curvature.
