The zebrafish (*Danio rerio*) is a freshwater fish belonging to the minnow family of the order Cypriniformes. Native to the Himalayan region, it is a popular aquarium fish, frequently sold under the trade name zebra danio (and thus often called a "tropical fish" although not native to the tropics). The zebrafish is also an important and widely used vertebrate model organism in scientific research ...

Molecular cloning is a set of experimental methods in molecular biology that are used to assemble recombinant DNA molecules and to direct their replication within host organisms. The use of the word cloning refers to the fact that the method involves the replication of one molecule to produce a population of cells with identical DNA molecules. Molecular cloning generally uses DNA sequences ...

Methods. We identified a patient with a mutation in the *DYRK1A* gene using microarray analysis. Circumventing the barrier of murine model studies, we generated a *dyrk1aa* KO zebrafish using transcription activator-like effector nuclease (TALEN)-mediated genome editing. For social behavioral tests, we have established a social interaction test, shoaling assay, and group behavior assay.

Microplastic (MP) are environmental pollutants and have the potential to cause varying degrees of aquatic toxicity. In this study, the effects on gut microbiota of adult male zebrafish exposed for 14 days to 100 and 1000 µg/L of two sizes of polystyrene MP were evaluated.

An environmental trigger, the herbicide linuron boosts astrocyte pathogenic activities in the context of CNS inflammation by activating IRE1±-XBP1 signaling in mice and, potentially, multiple sclerosis patients.

HSPCs maintain hematopoietic output by generating the whole spectrum of blood cell lineages in vertebrate animals. Previous studies demonstrate that blood vessels play an essential role in HSPC specification in development (1â€“4). During embryogenesis, HSPCs are emerged from a rare population of endothelial cells (ECs) residing on the floor of the dorsal aorta (DA) (1â€“4).

A progressive loss of TAK1-mediated RIPK1 inhibition can synergize with genetic risk factors to promote neuroinflammation and provides a direct link between aging and the onset of neurodegenerative disorders.

Biological Activity. Selective p160ROCK inhibitor ( $K_i$  values are 0.14, 26, 25 and  $> 250 \mu\text{M}$  for p160ROCK, PKC, PKA and MLCK respectively). Also inhibits PRK2 ( $IC_{50} = 600 \text{ nM}$ ). Smooth muscle relaxant and orally active in vivo. Increases survival rate of human embryonic stem (hES) cells and iPSC-BMECs undergoing cryopreservation.

A. General information. Haematologica publishes articles in the broad field of hematology, reporting on novel findings in basic, clinical and translational research.. The scope of the journal is to report novel research results that have an important impact on our understanding of normal hematology or the development of hematological diseases, or are likely to bring important changes to the ...

Microglia, the brain's primary immune sentinels, quickly regenerate and restore their population after an acute insult. Lihong Zhan, Li Gan and colleagues use lineage tracing to address the debate about the origin of repopulating microglia and describes the spatial and temporal characteristics of microglial regeneration.

scikit-image is an image processing library that implements algorithms and utilities for use in research, education and industry applications. It is released under the liberal Modified BSD open source license, provides a well-documented API in the Python programming language, and is developed by an active, international team of collaborators.
