A radionuclide (radioactive nuclide, radioisotope or radioactive isotope) is an atom that has excess nuclear energy, making it unstable. This excess energy can be used in one of three ways: emitted from the nucleus as gamma radiation; transferred to one of its electrons to release it as a conversion electron; or used to create and emit a new particle (alpha particle or beta particle) from the ...

The HASPI Curriculum Resources are available free for use by educators. All of the resources align with the Next Generation Science Standards (NGSS) and Common Core State Standards (CCSS).

HASPI Curriculum

Nuclear chemistry is the subfield of chemistry dealing with radioactivity, nuclear processes, such as nuclear transmutation, and nuclear properties.. It is the chemistry of radioactive elements such as the actinides, radium and radon together with the chemistry associated with equipment (such as nuclear reactors) which are designed to perform nuclear processes.

In collaborations that combine our expertise with that of industry, academia and other government laboratories, our scientists and engineers deliver research tools and solutions that enable access to affordable, environmentally clean energy, and reduce our dependence on foreign energy sources.

Energy Research and Development | Argonne National Laboratory

It should be emphasized that, as has been shown by Fischer (1964), Pomar and Ward (1999), Goldhammer, et al, (1990), and D'Argenio et al (1997) that though shallow cycle s of carbonate are composed of a relatively conformable succession of genetically related beds or bedset s these cycle s are often truncated and incomplete so that maximum flooding and transgressive surfaces can be missing.
