

scheduling and congestion control pdf

Network congestion in data networking and queueing theory is the reduced quality of service that occurs when a network node or link is carrying more data than it can handle. Typical effects include queueing delay, packet loss or the blocking of new connections. A consequence of congestion is that an incremental increase in offered load leads either only to a small increase or even a decrease ...

Round-robin (RR) is one of the algorithms employed by process and network schedulers in computing. As the term is generally used, time slices (also known as time quanta) are assigned to each process in equal portions and in circular order, handling all processes without priority (also known as cyclic executive). Round-robin scheduling is simple, easy to implement, and starvation-free.

Figure 1 a, b: Septal perforations can be seen on physical examination of the nose as a through-and-through hole in the nasal septum. Unobstructed light can easily be seen through the opposite nostril. Turbulent airflow through a nasal septal perforation causes excessive drying and crusting within the nose, which can lead to chronic nosebleeds, purulent discharge, foul odors and nasal congestion.
